

Homework-1

a) Goal and objectives:

Observe flow control mechanism and decrease the variance of packet interarrival times of the packets while maintaining minimum packet queue length.

b) State Variables:

(i) $P(t)$ → no. of packets in packet queue

(ii) $K(t)$ → no. of tokens in token queue

Output Variables:

(i) Average Packet Delay (Job-average)

(ii) Average Packet Queue Length (Time average)

(iii) Packet Variance

c) Set of Events:

(i) Packet Arrival

(ii) Token Creation

d) State Equations:

For packet queue length

$$P(t^+) = \begin{cases} k(t) == 0? & r(t) + 1 : p(t) & \text{packet arrival} \\ p(t) != 0? & p(t) - 1 : p(t) & \text{token creation} \\ p(t) & & \rho/w \end{cases}$$

~~For~~

For tokens in token queue

$$K(t^+) = \begin{cases} k(t) != 0? & k(t) - 1 : k(t) & \text{packet arrival} \\ p(t) == 0? & k(t) + 1 : k(t) & \text{token creation} \\ k(t) & & 0/w \end{cases}$$

~~Output~~ Output Equations:

(i) Average Packet Delay:

Every packet has an interarrival time, The packet will depart when token for that packet is created.

If packet arrival time is a_i and token creation time for i^{th} packet is b_i , then,

$$\text{Packet delay, } d_i = \max(b_i - a_i, 0)$$

Let, tokens are created at a fixed rate λ .

$$\text{So, } b_i = \lambda i$$

$$\text{Average packet delay, } \bar{d} = \frac{\sum_{i=0}^{n-1} d_i}{n}$$

(ii) Average Packet Queue Length:

(ii) Let, ^{packet} queue length at time t is, $q(t)$.

As queue length is time-dependent,

average queue length is, $\bar{q} = \frac{\int_0^T q(t) dt}{T}$
for $(0, T)$

where T is the simulation run-time.

(iii) Average Packet Variance: The variance of packet delay is

$$\sigma_d^2 = \frac{\sum_{i=0}^{n-1} (d_i - \bar{d})^2}{n}$$

e) In the simulation,

the sample space for $P(t)$ is $X_{P(t)} = \{0, 1, 2, 3, \dots\}$

the sample space for $K(t)$ is $X_K = \{0, 1, 2, 3, \dots\}$

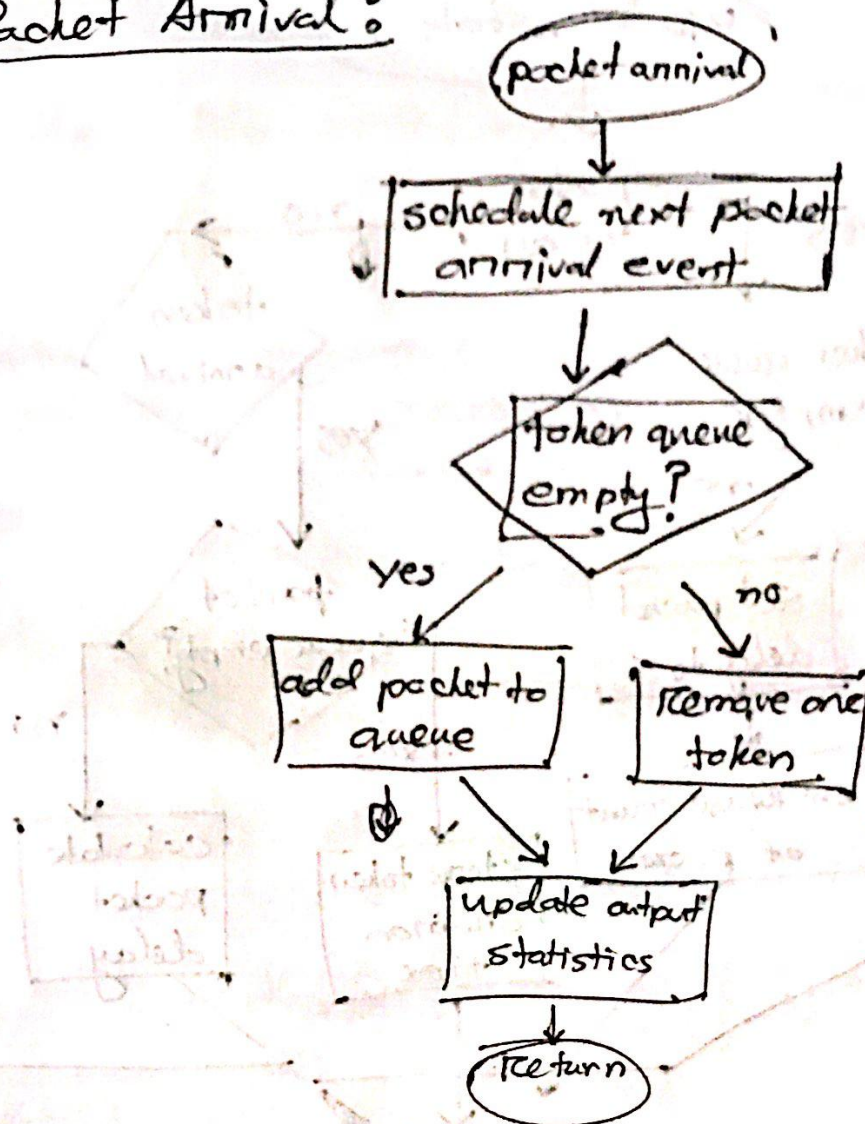

But both can't be non-empty at the same time.

So,

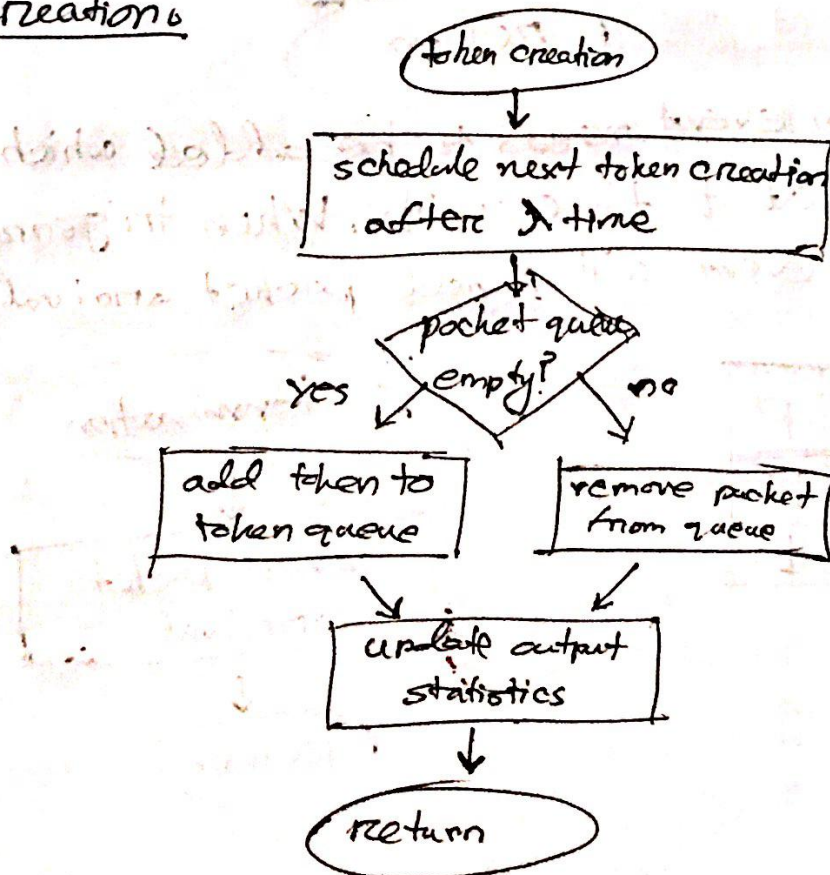

$$X = \{(0, 0), (0, 1), (0, 2), (0, 3), \dots, (1, 0), (2, 0), (3, 0), \dots\}$$

So, any natural number from 0 to infinity while one of the queue length is 0, or both are 0.

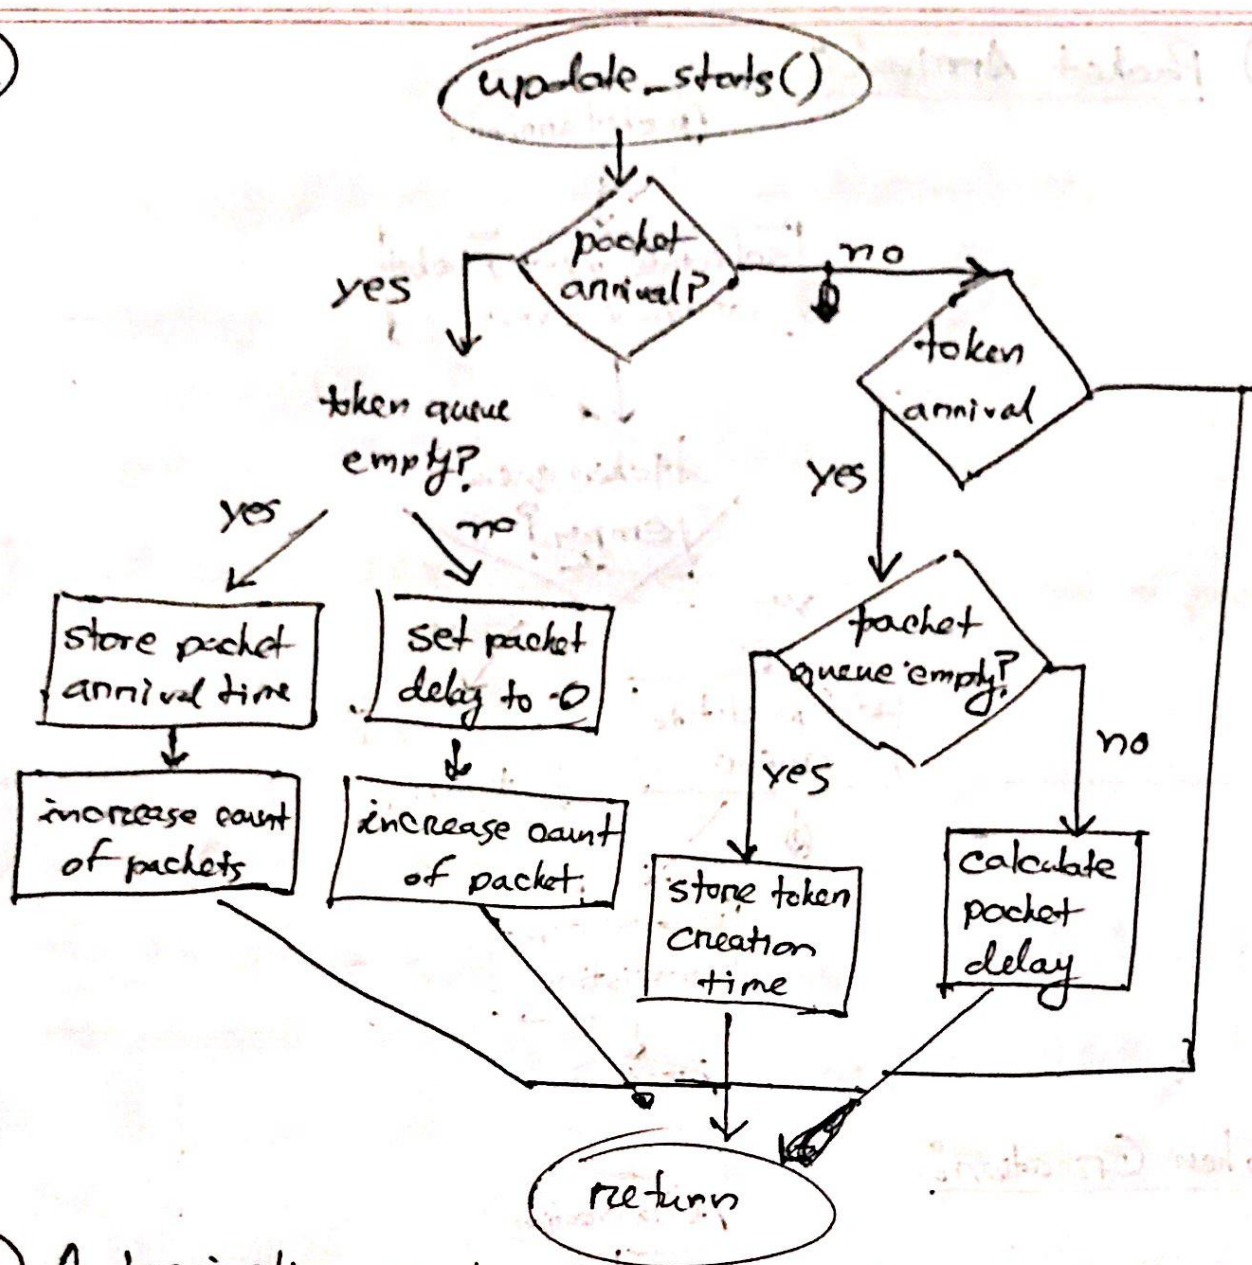

f) Packet Arrival:

Token Creation:

g)

h) A termination event needs to be added which will be scheduled at 't' time units. When triggered the termination event will cancel packet arrival

packet arrival	p
token creation	k
termination	t
