

Problem 1

In MATLAB notation, write the commands that define this matrix A and the column vectors x and b . What command would test whether or not $Ax = b$?

$$A = \begin{bmatrix} 2 & 3 \\ 4 & 5 \end{bmatrix} \text{ and } x = \begin{bmatrix} 1 \\ -7 \end{bmatrix} \text{ and } b = \begin{bmatrix} 24 \\ 5 \end{bmatrix}$$

Problem 2

The MATLAB commands $A = \text{eye}(3)$ and $v = [3: 5]'$ produce the 3 by 3 identity matrix and the column vector (3,4,5). What are the outputs from $A*v$ and $v'*v$? (Computer not needed!) If you ask for $v*A$, what happens?

Problem 3

If you multiply the 4 by 4 all-ones matrix $A = \text{ones}(4)$ and the column $v = \text{ones}(4,1)$, what is $A*v$? (Computer not needed.) If you multiply $B = \text{eye}(4) + \text{ones}(4)$ times $w = \text{zeros}(4,1) + 2*\text{ones}(4,1)$, what is $B*w$?

Problem 4

Use $\text{inv}(P)$ to invert MATLAB's 4 by 4 symmetric matrix $P = \text{pascal}(4)$.

Problem 5

Create Pascal's lower triangular $L = \text{abs}(\text{pascal}(4,1))$ and test $P = LL^T$.
