Ans. to Q.no. 2

The Nyquist Bit Rate formula is for idealistic noiseless scenarios where the maximum bit-rate is calculated

The formula is

$$N_{\max} = 2 \times B \times \log_2 L \quad \text{where } B \text{ is Bandwidth.}$$

L is no. of signal levels

It gives us the theoretical highest bit rate.

Given, highest and lowest signal is 4 Hz and 3 Hz.

$$\text{So, Bandwidth} = (4 - 3) = 1 \text{ MHz}$$

$$\text{SNR}_{\text{dB}} = 24 \text{ dB}$$

$$\Rightarrow \text{But, } \text{SNR}_{\text{dB}} = 10 \log_{10} \text{SNR}$$

$$\Rightarrow 24 = 10 \log_{10} \text{SNR}$$

$$\therefore \text{SNR} = 10^{2.4}$$

$$= 251.19$$

$$\text{Shannon Capacity, } C = B \times \log_2 (1 + \text{SNR})$$

$$= 1 \times 10^6 \times \log_2 (251.19 + 1)$$

$$= 7.98 \text{ Mbps}$$

$$\text{Now, } 7.97 = 2 \times B \times \log_2 L$$

$$\Rightarrow \frac{7.97}{2 \times 1} = \log_2 L$$

$$\Rightarrow \log_2 L = 4$$

$$\therefore L = 16 \text{ (Ans.)}$$

Ans. to Q.no. 31

(i)

The scrambler manipulates the data stream before transmission. Scrambling is the procedure by which these sequence of data is manipulated and undesirable sequences are removed.

(ii)

Bandwidth delay product is the product of data

(iii)

Jitter is the time difference of data packets getting received. ~~Sometimes~~ ~~to~~ ~~Data packets~~ ~~with~~

Ans. to Q. no (1)

Q.1

AMR

Bandwidth requirement is $N/2$

Polar NRZ

Bandwidth requirement is N

Manchester

MLT-3

$$\text{Bandwidth} = N/3$$

NRZ-DI

$$\text{Bandwidth} = N/2$$
