# **Course Title:** Microprocessors and Assembly Language Lab (CSE-4504)

Department of Computer Science and Engineering (CSE)

## Islamic University of Technology (IUT), Gazipur

### Lab # 04

Understanding Advanced 8086 I/O Instructions using Array in Assembly Language Program.

#### **Objective:**

To understand some advanced 8086 instructions and getting familiar with the use of Array in Assembly Language Program.

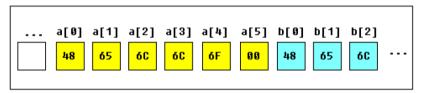

### Theory:

#### • Array

Arrays can be seen as chains of variables. A text string is an example of a byte array; each character is presented as an ASCII code value (0..255). Here are some array definition examples:

```
a DB 48h, 65h, 6Ch, 6Ch, 6Fh, 00h b DB 'Hello', 0
```

b is an exact copy of the an array, when compiler sees a string inside quotes it automatically converts it to set of bytes. This chart shows a part of the memory where these arrays are declared:

You can access the value of any element in array using square brackets, for example:

You can also use any of the memory index registers **BX**, **SI**, **DI**, **BP**, for example:

```
MOV SI, 3
MOV AL, a[SI]
```

If you need to declare a large array with same value you can use **DUP** operator. The syntax for **DUP**: For example:

```
c DB 5 DUP(0)
c DB 0, 0, 0, 0, 0 ; is an alternative way of declaring:
```

one more example:

```
d DB 5 DUP(1, 2)
d DB 1, 2, 1, 2, 1, 2, 1, 2 ; is an alternative way of declaring:
```

Of course, you can use **DW** instead of **DB** if it's required to keep values larger then 255, or smaller then -128. **DW** cannot be used to declare strings!

.

## **Assembly Language Program Example for Array:**

To derive summation of a series 1 + 2 + 3 using array. Here, value of N is given by user where N=3 and output is shown in the output window:

```
org 100h
.DATA
                                           ; Data segment starts
A db 3, 1, 2
                                           ;1-D array for number
B db 00h
message db 'Enter the value of N:$'
                                          ;1-D array for string
.CODE
                                           ; Code segment starts
MAIN PROC
mov ax, @DATA
mov ds. ax
xor ax,ax
mov si, OFFSET A
mov di, OFFSET B
mov dx, OFFSET message; Load Effective Address of the message in DX register
; lea dx, message ; (similar meaning like Load Effective Address)
                                           display string function
mov ah, 09h
int 21h
                                           ;display message
mov ah, 01h
int 21h
mov cl, al
sub cl, 48
                     to convert the ascii value of 3 to decimal 3
xor al, al
Loop_1:
       add al, [Si]
       inc Si
       loop Loop_1
mov bl, al
add bl. 48
                     ; to convert the ascii value of the output to decimal
mov ah. 02h
mov dl. bl
int 21h
MAIN ENDP
END MAIN
RET
```

## Tasks to do:

1. Write an assembly language code to derive the final value of the number sequence 1<sup>2</sup>+2<sup>2</sup>+3<sup>2</sup>+4<sup>2</sup>+.....+N<sup>2</sup>. (**use ARRAY and Loop**). Take the input value of N (in between 2 to 9) as a single ASCII character and then adjust it to actual decimal value in your program. Finally, store and show the output in a variable named RESULT.

#### **Sample Input / Output:**

Input: The value of N in between  $2 \sim 9$ The result is: 285
